# Python Lab Exercise #2

## Objectives:

- Load .csv files into `pandas` DataFrames
- Describe and manipulate data in Series and DataFrames
- Visualize data using DataFrame methods and `matplotlib`

In [1]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

## What is Pandas?

Pandas, as the Anaconda docs tell us, offers us "High-performance, easy-to-use data structures and data analysis tools." It's something like "Excel for Python", but it's quite a bit more powerful.

Let's read in the heart dataset.

Pandas has many methods for reading different types of files. Note that here we have a .csv file.

Read about this dataset here.

In [2]:
```
heart_df = pd.read_csv('./data/heart.csv')
```

The output of the `.read_csv()` function is a pandas *DataFrame*, which has a familiar tabaular structure of rows and columns.

In [3]:
```
type(heart_df)
```

Out[3]:
```
pandas.core.frame.DataFrame
```

In [4]:
```
heart_df
```

Out[4]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | ta |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 63 | 1 | 3 | 145 | 233 | 1 | 0 | 150 | 0 | 2.3 | 0 | 0 | 1 | |
| **1** | 37 | 1 | 2 | 130 | 250 | 0 | 1 | 187 | 0 | 3.5 | 0 | 0 | 2 | |
| **2** | 41 | 0 | 1 | 130 | 204 | 0 | 0 | 172 | 0 | 1.4 | 2 | 0 | 2 | |
| **3** | 56 | 1 | 1 | 120 | 236 | 0 | 1 | 178 | 0 | 0.8 | 2 | 0 | 2 | |
| **4** | 57 | 0 | 0 | 120 | 354 | 0 | 1 | 163 | 1 | 0.6 | 2 | 0 | 2 | |
| **...** | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | |
| **298** | 57 | 0 | 0 | 140 | 241 | 0 | 1 | 123 | 1 | 0.2 | 1 | 0 | 3 | |
| **299** | 45 | 1 | 3 | 110 | 264 | 0 | 1 | 132 | 0 | 1.2 | 1 | 0 | 3 | |
| **300** | 68 | 1 | 0 | 144 | 193 | 1 | 1 | 141 | 0 | 3.4 | 1 | 2 | 3 | |
| **301** | 57 | 1 | 0 | 130 | 131 | 0 | 1 | 115 | 1 | 1.2 | 1 | 1 | 3 | |
| **302** | 57 | 0 | 1 | 130 | 236 | 0 | 0 | 174 | 0 | 0.0 | 1 | 1 | 2 | |

303 rows × 14 columns

## DataFrames and Series

Two main types of pandas objects are the DataFrame and the Series, the latter being in effect a single column of the former:

In [5]:
```
age_series = heart_df['age']
type(age_series)
```

Out[5]:
```
pandas.core.series.Series
```

Notice how we can isolate a column of our DataFrame simply by using square brackets together with the name of the column.

Both Series and DataFrames have an *index* as well:

In [6]:
```
heart_df.index
```

Out[6]:
```
RangeIndex(start=0, stop=303, step=1)
```

In [7]:
```
age_series.index
```

Out[7]:
```
RangeIndex(start=0, stop=303, step=1)
```

Pandas is built on top of NumPy, and we can always access the NumPy array underlying a DataFrame using `.values`.

In [8]:
```
heart_df.values
```

Out[8]:
```
array([[63.,  1.,  3., ...,  0.,  1.,  1.],
       [37.,  1.,  2., ...,  0.,  2.,  1.],
       [41.,  0.,  1., ...,  0.,  2.,  1.],
       ...,
       [68.,  1.,  0., ...,  2.,  3.,  0.],
       [57.,  1.,  0., ...,  1.,  3.,  0.],
       [57.,  0.,  1., ...,  1.,  2.,  0.]])
```

# Basic DataFrame Attributes and Methods

## .head()

In [9]:
```
heart_df.head()
```

Out[9]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | targe |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 63 | 1 | 3 | 145 | 233 | 1 | 0 | 150 | 0 | 2.3 | 0 | 0 | 1 | |
| **1** | 37 | 1 | 2 | 130 | 250 | 0 | 1 | 187 | 0 | 3.5 | 0 | 0 | 2 | |
| **2** | 41 | 0 | 1 | 130 | 204 | 0 | 0 | 172 | 0 | 1.4 | 2 | 0 | 2 | |
| **3** | 56 | 1 | 1 | 120 | 236 | 0 | 1 | 178 | 0 | 0.8 | 2 | 0 | 2 | |
| **4** | 57 | 0 | 0 | 120 | 354 | 0 | 1 | 163 | 1 | 0.6 | 2 | 0 | 2 | |

## .tail()

In [10]:
```
heart_df.tail()
```

Out[10]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | ta |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **298** | 57 | 0 | 0 | 140 | 241 | 0 | 1 | 123 | 1 | 0.2 | 1 | 0 | 3 | |
| **299** | 45 | 1 | 3 | 110 | 264 | 0 | 1 | 132 | 0 | 1.2 | 1 | 0 | 3 | |
| **300** | 68 | 1 | 0 | 144 | 193 | 1 | 1 | 141 | 0 | 3.4 | 1 | 2 | 3 | |
| **301** | 57 | 1 | 0 | 130 | 131 | 0 | 1 | 115 | 1 | 1.2 | 1 | 1 | 3 | |
| **302** | 57 | 0 | 1 | 130 | 236 | 0 | 0 | 174 | 0 | 0.0 | 1 | 1 | 2 | |

## .info()

In [11]:
```
heart_df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 303 entries, 0 to 302
Data columns (total 14 columns):

| **75%** | 61.000000 | 1.000000 | 2.000000 | 140.000000 | 274.500000 | 0.000000 | 1.000000 |
| **max** | 77.000000 | 1.000000 | 3.000000 | 200.000000 | 564.000000 | 1.000000 | 2.000000 |

## .dtypes

In [13]:
```
heart_df.dtypes
```

Out[13]:
```
age           int64
sex           int64
cp            int64
trestbps      int64
chol          int64
fbs           int64
restecg       int64
thalach       int64
exang         int64
oldpeak     float64
slope         int64
ca            int64
thal          int64
target        int64
dtype: object
```

### `.shape`

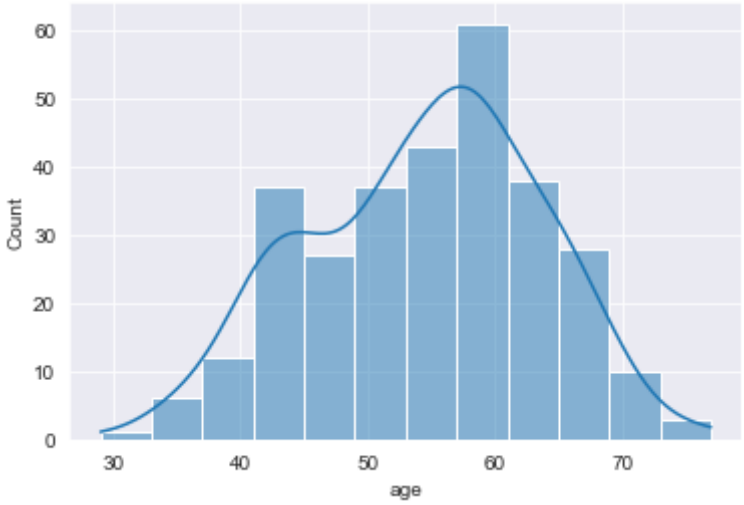
In [14]:
```
heart_df.shape
```

Out[14]:
```
(303, 14)
```

## Exploratory Plots

Let's make ourselves a histogram of ages:

In [15]:
```
sns.set_style('darkgrid')
#sns.distplot(a=heart_df['age']);
# For more recent versions of seaborn:
sns.histplot(data=heart_df['age'], kde=True);
```



And while we're at it let's do a scatter plot of maximum heart rate vs. age:

In [16]:
```
sns.scatterplot(x=heart_df['age'], y=heart_df['thalach']);
```

# Adding to a DataFrame

## Adding Rows

Here are two rows that our engineer accidentally left out of the .csv file, expressed as a Python dictionary:

In [17]:
```
extra_rows = {'age': [40, 30], 'sex': [1, 0], 'cp': [0, 0], 'trestbps': [120, 1
              'chol': [240, 200],
             'fbs': [0, 0], 'restecg': [1, 0], 'thalach': [120, 122], 'exang':
              'oldpeak': [0.1, 1.0], 'slope': [1, 1], 'ca': [0, 1], 'thal': [2,
              'target': [0, 0]}
extra_rows
```

Out[17]:
```
{'age': [40, 30],
 'sex': [1, 0],
 'cp': [0, 0],
 'trestbps': [120, 130],
 'chol': [240, 200],
 'fbs': [0, 0],
 'restecg': [1, 0],
 'thalach': [120, 122],
 'exang': [0, 1],
 'oldpeak': [0.1, 1.0],
 'slope': [1, 1],
 'ca': [0, 1],
 'thal': [2, 3],
 'target': [0, 0]}
```

How can we add this to the bottom of our dataset?

In [18]:
```
# Let's first turn this into a DataFrame.
# We can use the .from_dict() method.

missing = pd.DataFrame(extra_rows)
missing
```

Out[18]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | targe |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 40 | 1 | 0 | 120 | 240 | 0 | 1 | 120 | 0 | 0.1 | 1 | 0 | 2 | |
| **1** | 30 | 0 | 0 | 130 | 200 | 0 | 0 | 122 | 1 | 1.0 | 1 | 1 | 3 | |

In [19]:
```
# Now we just need to concatenate the two DataFrames together.
# Note the `ignore_index` parameter! We'll set that to True.

heart_augmented = pd.concat([heart_df, missing],
                            ignore_index=True)
```

In [20]:
```
# Let's check the end to make sure we were successful!

heart_augmented.tail()
```

Out[20]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | tar |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **300** | 68 | 1 | 0 | 144 | 193 | 1 | 1 | 141 | 0 | 3.4 | 1 | 2 | 3 | |
| **301** | 57 | 1 | 0 | 130 | 131 | 0 | 1 | 115 | 1 | 1.2 | 1 | 1 | 3 | |
| **302** | 57 | 0 | 1 | 130 | 236 | 0 | 0 | 174 | 0 | 0.0 | 1 | 1 | 2 | |
| **303** | 40 | 1 | 0 | 120 | 240 | 0 | 1 | 120 | 0 | 0.1 | 1 | 0 | 2 | |
| **304** | 30 | 0 | 0 | 130 | 200 | 0 | 0 | 122 | 1 | 1.0 | 1 | 1 | 3 | |

## Adding Columns

Adding a column is very easy in `pandas`. Let's add a new column to our dataset called "test", and set all of its values to 0.

In [21]:
```
heart_augmented['test'] = 0
```

In [22]:
```
heart_augmented.head()
```

Out[22]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | targe |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 63 | 1 | 3 | 145 | 233 | 1 | 0 | 150 | 0 | 2.3 | 0 | 0 | 1 | |
| **1** | 37 | 1 | 2 | 130 | 250 | 0 | 1 | 187 | 0 | 3.5 | 0 | 0 | 2 | |
| **2** | 41 | 0 | 1 | 130 | 204 | 0 | 0 | 172 | 0 | 1.4 | 2 | 0 | 2 | |
| **3** | 56 | 1 | 1 | 120 | 236 | 0 | 1 | 178 | 0 | 0.8 | 2 | 0 | 2 | |
| **4** | 57 | 0 | 0 | 120 | 354 | 0 | 1 | 163 | 1 | 0.6 | 2 | 0 | 2 | |

I can also add columns whose values are functions of existing columns.

Suppose I want to add the cholesterol column ("chol") to the resting systolic blood pressure column ("trestbps"):

In [23]:
```
heart_augmented['chol+trestbps'] = heart_augmented['chol'] + heart_augmented['t
```

In [24]:
```
heart_augmented.head()
```

Out[24]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | targe |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 63 | 1 | 3 | 145 | 233 | 1 | 0 | 150 | 0 | 2.3 | 0 | 0 | 1 | |
| **1** | 37 | 1 | 2 | 130 | 250 | 0 | 1 | 187 | 0 | 3.5 | 0 | 0 | 2 | |
| **2** | 41 | 0 | 1 | 130 | 204 | 0 | 0 | 172 | 0 | 1.4 | 2 | 0 | 2 | |
| **3** | 56 | 1 | 1 | 120 | 236 | 0 | 1 | 178 | 0 | 0.8 | 2 | 0 | 2 | |
| **4** | 57 | 0 | 0 | 120 | 354 | 0 | 1 | 163 | 1 | 0.6 | 2 | 0 | 2 | |

# Filtering

We can use filtering techniques to see only certain rows of our data. If we wanted to see only the rows for patients 70 years of age or older, we can simply type:

In [25]:
```
heart_augmented['age'] >= 70
```

Out[25]:
```
0       False
1       False
2       False
3       False
4       False
        ...
300     False
301     False
302     False
303     False
304     False
Name: age, Length: 305, dtype: bool
```

In [26]:
```
heart_augmented[heart_augmented['age'] >= 70]
```

Out[26]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | ta |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **25** | 71 | 0 | 1 | 160 | 302 | 0 | 1 | 162 | 0 | 0.4 | 2 | 2 | 2 | |
| **60** | 71 | 0 | 2 | 110 | 265 | 1 | 0 | 130 | 0 | 0.0 | 2 | 1 | 2 | |
| **129** | 74 | 0 | 1 | 120 | 269 | 0 | 0 | 121 | 1 | 0.2 | 2 | 1 | 2 | |
| **144** | 76 | 0 | 2 | 140 | 197 | 0 | 2 | 116 | 0 | 1.1 | 1 | 0 | 2 | |
| **145** | 70 | 1 | 1 | 156 | 245 | 0 | 0 | 143 | 0 | 0.0 | 2 | 0 | 2 | |
| **151** | 71 | 0 | 0 | 112 | 149 | 0 | 1 | 125 | 0 | 1.6 | 1 | 0 | 2 | |
| **225** | 70 | 1 | 0 | 145 | 174 | 0 | 1 | 125 | 1 | 2.6 | 0 | 0 | 3 | |
| **234** | 70 | 1 | 0 | 130 | 322 | 0 | 0 | 109 | 0 | 2.4 | 1 | 3 | 2 | |
| **238** | 77 | 1 | 0 | 125 | 304 | 0 | 0 | 162 | 1 | 0.0 | 2 | 3 | 2 | |
| **240** | 70 | 1 | 2 | 160 | 269 | 0 | 1 | 112 | 1 | 2.9 | 1 | 1 | 3 | |

Use '&' for "and" and '|' for "or".

## Exercise

Display the patients who are 70 or over as well as the patients whose trestbps score is greater than 170.

In [27]:
```
# Enter your code here
heart_augmented[(heart_augmented['age'] >= 70 ) | (heart_augmented['trestbps']
```

Out[27]:

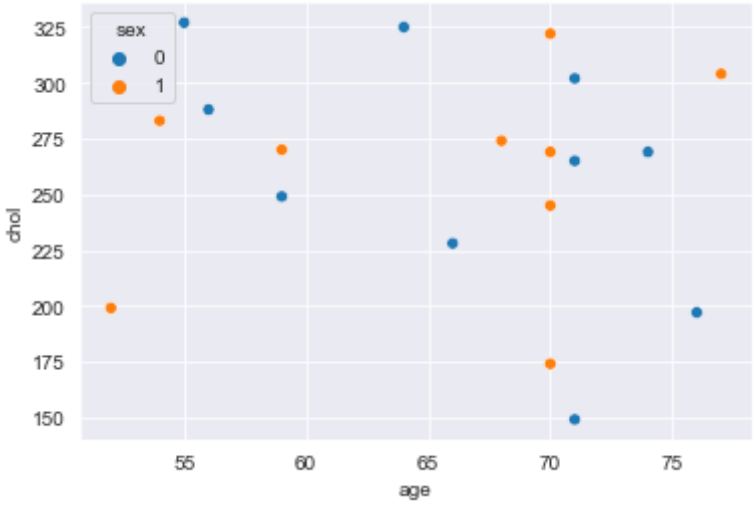
| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | ta |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **8** | 52 | 1 | 2 | 172 | 199 | 1 | 1 | 162 | 0 | 0.5 | 2 | 0 | 3 | |
| **25** | 71 | 0 | 1 | 160 | 302 | 0 | 1 | 162 | 0 | 0.4 | 2 | 2 | 2 | |
| **60** | 71 | 0 | 2 | 110 | 265 | 1 | 0 | 130 | 0 | 0.0 | 2 | 1 | 2 | |
| **101** | 59 | 1 | 3 | 178 | 270 | 0 | 0 | 145 | 0 | 4.2 | 0 | 0 | 3 | |
| **110** | 64 | 0 | 0 | 180 | 325 | 0 | 1 | 154 | 1 | 0.0 | 2 | 0 | 2 | |
| **129** | 74 | 0 | 1 | 120 | 269 | 0 | 0 | 121 | 1 | 0.2 | 2 | 1 | 2 | |
| **144** | 76 | 0 | 2 | 140 | 197 | 0 | 2 | 116 | 0 | 1.1 | 1 | 0 | 2 | |
| **145** | 70 | 1 | 1 | 156 | 245 | 0 | 0 | 143 | 0 | 0.0 | 2 | 0 | 2 | |
| **151** | 71 | 0 | 0 | 112 | 149 | 0 | 1 | 125 | 0 | 1.6 | 1 | 0 | 2 | |
| **203** | 68 | 1 | 2 | 180 | 274 | 1 | 0 | 150 | 1 | 1.6 | 1 | 0 | 3 | |
| **223** | 56 | 0 | 0 | 200 | 288 | 1 | 0 | 133 | 1 | 4.0 | 0 | 2 | 3 | |
| **225** | 70 | 1 | 0 | 145 | 174 | 0 | 1 | 125 | 1 | 2.6 | 0 | 0 | 3 | |
| **234** | 70 | 1 | 0 | 130 | 322 | 0 | 0 | 109 | 0 | 2.4 | 1 | 3 | 2 | |
| **238** | 77 | 1 | 0 | 125 | 304 | 0 | 0 | 162 | 1 | 0.0 | 2 | 3 | 2 | |
| **240** | 70 | 1 | 2 | 160 | 269 | 0 | 1 | 112 | 1 | 2.9 | 1 | 1 | 3 | |
| **241** | 59 | 0 | 0 | 174 | 249 | 0 | 1 | 143 | 1 | 0.0 | 1 | 0 | 2 | |
| **248** | 54 | 1 | 1 | 192 | 283 | 0 | 0 | 195 | 0 | 0.0 | 2 | 1 | 3 | |
| **260** | 66 | 0 | 0 | 178 | 228 | 1 | 1 | 165 | 1 | 1.0 | 1 | 2 | 3 | |
| **266** | 55 | 0 | 0 | 180 | 327 | 0 | 2 | 117 | 1 | 3.4 | 1 | 0 | 2 | |

## Exploratory Plot

Using the subframe we just made, let's make a scatter plot of their cholesterol levels vs. age and color by sex:

In [28]:
```
at_risk = heart_augmented[(heart_augmented['age'] >= 70 ) | (heart_augmented['t

sns.scatterplot(data=at_risk, x='age', y='chol', hue='sex');
```



## `.loc` and `.iloc`

We can use `.loc` to get, say, the first ten values of the age and resting blood pressure ("trestbps") columns:

In [29]:
```
heart_augmented.loc
```

Out[29]:
```
<pandas.core.indexing._LocIndexer at 0x7fa6837887c0>
```

In [30]:
```
heart_augmented.loc[:9, ['age', 'trestbps']]
```

Out[30]:

| | age | trestbps |
|---|---|---|
| **0** | 63 | 145 |
| **1** | 37 | 130 |
| **2** | 41 | 130 |
| **3** | 56 | 120 |
| **4** | 57 | 120 |
| **5** | 57 | 140 |
| **6** | 56 | 140 |
| **7** | 44 | 120 |
| **8** | 52 | 172 |
| **9** | 57 | 150 |

`.iloc` is used for selecting locations in the DataFrame **by number**:

In [31]:
```
heart_augmented.iloc
```

Out[31]:
```
<pandas.core.indexing._iLocIndexer at 0x7fa6838ac310>
```

In [32]:
```
heart_augmented.iloc[3, 0]
```

Out[32]: 56

In [33]:
```
heart_augmented.head()
```

Out[33]:

| | age | sex | cp | trestbps | chol | fbs | restecg | thalach | exang | oldpeak | slope | ca | thal | targe |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | 63 | 1 | 3 | 145 | 233 | 1 | 0 | 150 | 0 | 2.3 | 0 | 0 | 1 | |
| **1** | 37 | 1 | 2 | 130 | 250 | 0 | 1 | 187 | 0 | 3.5 | 0 | 0 | 2 | |
| **2** | 41 | 0 | 1 | 130 | 204 | 0 | 0 | 172 | 0 | 1.4 | 2 | 0 | 2 | |
| **3** | 56 | 1 | 1 | 120 | 236 | 0 | 1 | 178 | 0 | 0.8 | 2 | 0 | 2 | |
| **4** | 57 | 0 | 0 | 120 | 354 | 0 | 1 | 163 | 1 | 0.6 | 2 | 0 | 2 | |

## Exercise

How would we get the same slice as just above by using .iloc() instead of .loc()?

In [34]:
```
# Enter your code here

heart_augmented.iloc[:10,0:4:3]
```

Out[34]:

| | age | trestbps |
|---|---|---|
| **0** | 63 | 145 |
| **1** | 37 | 130 |
| **2** | 41 | 130 |
| **3** | 56 | 120 |
| **4** | 57 | 120 |
| **5** | 57 | 140 |
| **6** | 56 | 140 |
| **7** | 44 | 120 |
| **8** | 52 | 172 |
| **9** | 57 | 150 |

# Statistics

## `.mean()`

In [35]:
```
heart_augmented.mean()
```

Out[35]:
```
age               54.239344
sex                0.681967
cp                 0.960656
trestbps         131.580328
chol             246.091803
fbs                0.147541
restecg            0.527869
thalach          149.459016
exang              0.327869
oldpeak            1.036393
slope              1.396721
ca                 0.727869
thal               2.314754
target             0.540984
test               0.000000
chol+trestbps    377.672131
dtype: float64
```

Be careful! Some of these will are not straightforwardly interpretable. What does an average "sex" of 0.682 mean?

## `.min()`

In [36]:
```
heart_augmented.min()
```

Out[36]:
```
age               29.0
sex                0.0
cp                 0.0
trestbps          94.0
chol             126.0
fbs                0.0
restecg            0.0
thalach           71.0
exang              0.0
oldpeak            0.0
slope              0.0
ca                 0.0
thal               0.0
target             0.0
test               0.0
chol+trestbps    249.0
dtype: float64
```

## `.max()`

In [37]:
```
heart_augmented.max()
```

Out[37]:
```
age               77.0
sex                1.0
cp                 3.0
trestbps         200.0
chol             564.0
fbs                1.0
restecg            2.0
thalach          202.0
exang              1.0
oldpeak            6.2
slope              2.0
ca                 4.0
thal               3.0
target             1.0
test               0.0
chol+trestbps    679.0
dtype: float64
```

# Series Methods

## `.value_counts()`

How many different values does slope have? What about sex? And target?

In [38]:
```
heart_augmented['slope'].value_counts()
```

Out[38]:
```
2    142
1    142
0     21
Name: slope, dtype: int64
```

In [39]:
```
heart_augmented['sex'].value_counts()
```

Out[39]:
```
1    208
0     97
Name: sex, dtype: int64
```

## `.sort_values()`

In [40]:
```
heart_augmented['age'].sort_values()
```

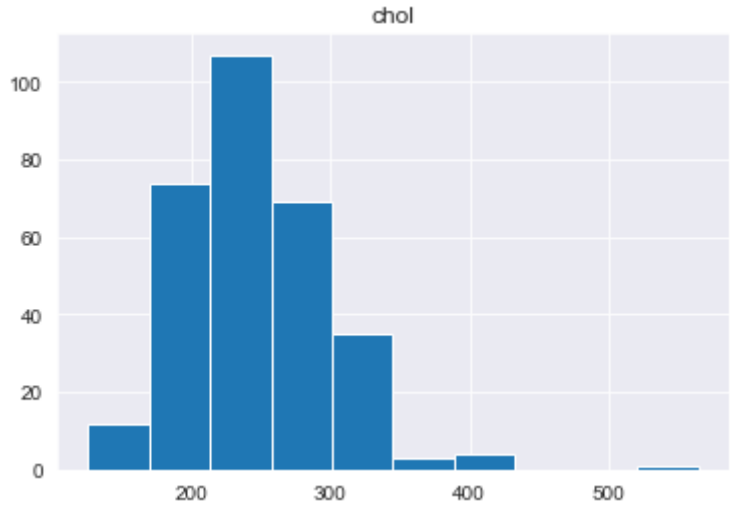
Out[40]:
```
72      29
304     30
58      34
125     34
65      35
        ..
25      71
60      71
129     74
144     76
238     77
Name: age, Length: 305, dtype: int64
```

# `pandas` -Native Plotting

The `.plot()` and `.hist()` methods available for DataFrames use a wrapper around `matplotlib`:

In [41]:
```
heart_augmented.plot(x='age', y='trestbps', kind='scatter');
```

In [42]:
```
heart_augmented.hist(column='chol');
```



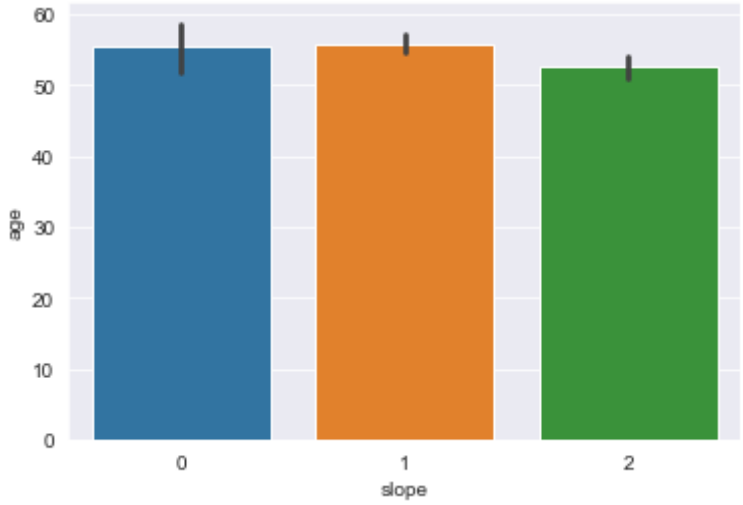
## Exercises

1. Make a bar plot of "age" vs. "slope" for the `heart_augmented` DataFrame.

In [43]:
```
# Enter your code here

sns.barplot(data = heart_augmented, x='slope',y='age')
```

Out[43]:
```
<AxesSubplot:xlabel='slope', ylabel='age'>
```



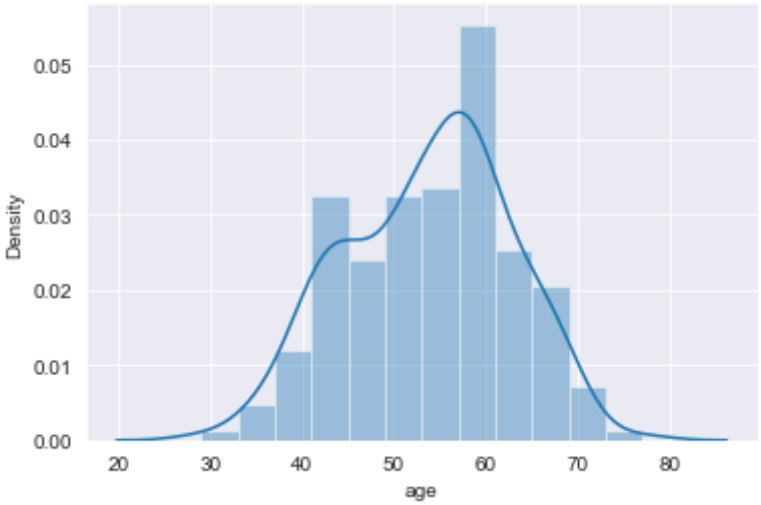
1. Make a histogram of ages for **just the men** in `heart_augmented` (heart_augmented['sex']=1).

In [48]:
```
# Enter your code here

men = heart_augmented[heart_augmented['sex']==1]
sns.distplot(a=men['age'])
```

```
/Users/SFSU/opt/anaconda3/lib/python3.9/site-packages/seaborn/distributions.p
y:2619: FutureWarning: `distplot` is a deprecated function and will be removed
in a future version. Please adapt your code to use either `displot` (a figure-
level function with similar flexibility) or `histplot` (an axes-level function
for histograms).
  warnings.warn(msg, FutureWarning)
```

Out[48]:
```
<AxesSubplot:xlabel='age', ylabel='Density'>
```

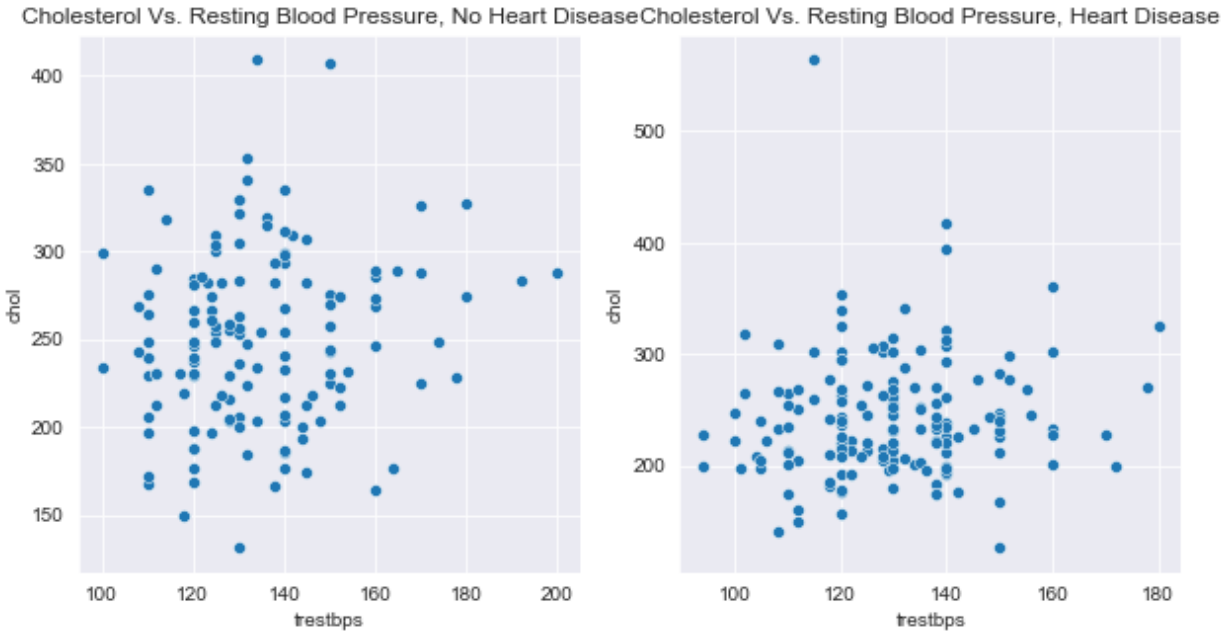


1. Make separate scatter plots of cholesterol vs. resting systolic blood pressure for the target=0 and the target=1 groups. Put both plots on the same figure and give each an appropriate title.

In [70]:
```
# Enter your code here
heart_augmented.head()
```

```
target_0 = heart_augmented[heart_augmented['target'] == 0];
target_1 = heart_augmented[heart_augmented['target'] == 1];
fig, axs = plt.subplots(1,2, figsize=(10,5))
sns.scatterplot(data = target_0, x='trestbps', y='chol', ax=axs[0])
sns.scatterplot(data = target_1, x='trestbps', y='chol', ax=axs[1])
axs[0].set_title("Cholesterol Vs. Resting Blood Pressure, No Heart Disease")
axs[1].set_title('Cholesterol Vs. Resting Blood Pressure, Heart Disease')
```

Out[70]: Text(0.5, 1.0, 'Cholesterol Vs. Resting Blood Pressure, Heart Disease')



In [ ]:
